# Chapter 1

## Introduction

### Overview

This report discusses the result of the work done on '**Patient Management System**' on Python IDLE Platform .The report provides common platform for facilitating the use of technological approach developed by our Health Department and integration of various tools developed during the execution of the project.

### Objective

The goal of the project is to:

- 1) Understand the working of software developed, with use of various tools already defined in Python.
- 2) Implement basic knowledge of **Database Connectivity** in this software application.

### Methodology

To implement the above goals, the following methodology needs to be followed:

- 1) Specifying the application and various components of GUI.
- 2) Specifying the bindings between the tasks and resources either manually or by the design tools.
- 3) Development of Python Program by using IDLE 3.7.
- 4) Storing data values in database and extracting them for further use.
- 5) Use of my SQL lite for database system

## Chapter 2

### Problem definition

We are going to build a software based Patient management system which will upload the data of patient that will have several features:

- 1) Record of Patient Detail.
- 2) Database Management System (DBMS).
- 3) Data stored and extraction using SQL lite .
- 4) Data Entry work.
- 5) GUI (Graphical User Interface).

## Chapter 3

## Conclusion

The Patient management system is developed using Python IDLE Platform fully meets the objectives of the system which it has been developed .The system has reached a steady state where all bugs have been eliminated. The system is operated at high level of efficiency and all the Doctors and Patient associated with the system understands its advantage. The system solves the problem. It was intended to solve as requirement specification.

## Chapter 7
